

B.E. (CE) Part-III 5th Semester Examination, 2007

Soil Mechanics-I (CE-504)

Time : 3 hours

Full Marks : 100

Use separate answerscript for each half.**FIRST HALF**(Answer Q.No.4 and any TWO from the rest.)

1. i) Explain the terms effective stress, neutral stress and total stress.
- ii) The water table in a certain area is at a depth of 2.0m below the ground surface. The densities of soil above and below the ground water level are 18 kN/m^3 and 20 kN/m^3 respectively. Calculate the effective pressure at a depth of 8.0 m below the ground surface. Draw total, effective and neutral stress diagram upto a depth of 6.0 m below ground surface when capillary rise is observed at ground surface. [6+9]

2. i) Deduce the relationship :

$$\sigma_1 = \sigma_3 N\phi + 2C \sqrt{N\phi}$$
- ii) In an in-situ vane shear test in a saturated clay, a torque of 42 Nm was required to shear the soil. The diameter of the vane was 50 mm and length 100 mm. Calculate the undrained shear strength of the clay. What will be sensitivity of the clay if the torque required to shear the soil in the remoulded state is 6 Nm? [10+5]

3. i) An undrained soil sample 40 mm dia and 80 mm long was tested in a triaxial apparatus under undrained condition. The sample failed under a deviator load 720 N and cell pressure of 150 kN/m^2 while the measured strain of the sample was 15%. Before the application of cell pressure pore water pressure was zero. The pore water pressure under the application of cell pressure was recorded as 135 kN/m^2 at 0% strain and at 15% strain the pore water pressure was 156 kN/m^2 . Calculate the values of pore pressure parameters.
- ii) State and explain different types of Triaxial test. [9+6]

4. Write short notes on any four of the following :

[4×5]

- i) e - $\log p$ curve
- ii) Formation classification of soil
- iii) Newmarks chart
- iv) Modes of occurrence of water in soil
- v) Normally consolidated and over consolidated clay
- vi) Field identification of soil types.

SECOND HALF

(Answer Q.No.5 and any TWO from the rest.)

5. In the field it was observed that water table is at a depth of 3.0 m below the existing ground surface. A mass of soil was taken in an sampling tube of internal diameter of 5 cm. The length of extracted soil sample was 10.2 cm and its weight was measured to be 387 gm. If the specific gravity of the soil solids is 2.70, and weight of the dried sample was 313 gm, find the bulk density in-situ water content, dry density, porosity, void ratio, and degree saturation of the soil sample. The sample was collected from a depth a 1.5 m below the ground surface. [6×3]
6. a) State the assumptions made in the hydrometer analysis for determining the particle size distribution of a soil. What are the limitations of the method? Explain the terms :
- i) Coefficient of curvature
 - ii) Uniformity coefficient, and
 - iii) Effective size, d_{10} .
- b) For a cohesive soil, liquid limit was determined to be 66% and its plasticity index was 44%. If the natural water content of the soil was 30%, find the (i) Plastic limit and (ii) Liquidity Index. Classify the soil from its plasticity Index. [(2+3+2+2+2)+(3+2)]
7. State Darcy's law for flow of water through pervious soil. What are the differences between discharge and seepage velocity of flow, and the relationship between them? Name the methods of determining coefficient of permeability of soils in laboratory and field. Explain in detail the method of falling head permeameter. If h_1 , h_2 and h_3 are heads in a falling head permeameter at start, t secs and $2t$ secs after start respectively, prove that $h_1 \cdot h_3 = h_2^2$. [3+3+2+2+4+2]

8. State the assumptions made in deriving the expression for vertical stress intensity σ_z at a point inside soil mass due to an applied point load Q at the surface, as done by Boussinesq. Find the vertical stress distribution along the load time due to a point load of 10^T at the surface. Choose at least 3 points at various depths along the load axis, for evaluation of the vertical stress. [4+3×4]

— — —

FIRST HALF

(Answer any 3 out of 4 and TWO from the rest.)

1. A soil mass is subjected to a vertical stress and total stress.

2. A soil mass is subjected to a vertical stress of 2.0m below the ground

3. A soil mass is subjected to a vertical stress below the ground water table and

4. A soil mass is subjected to a vertical stress. Calculate the effective pressure of

5. A soil mass is subjected to a vertical stress. Calculate the effective pressure of

6. A soil mass is subjected to a vertical stress. Calculate the effective pressure of

7. A soil mass is subjected to a vertical stress. Calculate the effective pressure of

8. A soil mass is subjected to a vertical stress. Calculate the effective pressure of

9. A soil mass is subjected to a vertical stress. Calculate the effective pressure of

10. A soil mass is subjected to a vertical stress. Calculate the effective pressure of

11. A soil mass is subjected to a vertical stress. Calculate the effective pressure of

12. A soil mass is subjected to a vertical stress. Calculate the effective pressure of

13. A soil mass is subjected to a vertical stress. Calculate the effective pressure of

14. A soil mass is subjected to a vertical stress. Calculate the effective pressure of

15. A soil mass is subjected to a vertical stress. Calculate the effective pressure of

16. A soil mass is subjected to a vertical stress. Calculate the effective pressure of

17. A soil mass is subjected to a vertical stress. Calculate the effective pressure of

18. A soil mass is subjected to a vertical stress. Calculate the effective pressure of

19. A soil mass is subjected to a vertical stress. Calculate the effective pressure of

20. A soil mass is subjected to a vertical stress. Calculate the effective pressure of

21. A soil mass is subjected to a vertical stress. Calculate the effective pressure of

22. A soil mass is subjected to a vertical stress. Calculate the effective pressure of

23. A soil mass is subjected to a vertical stress. Calculate the effective pressure of

24. A soil mass is subjected to a vertical stress. Calculate the effective pressure of

25. A soil mass is subjected to a vertical stress. Calculate the effective pressure of

26. A soil mass is subjected to a vertical stress. Calculate the effective pressure of

27. A soil mass is subjected to a vertical stress. Calculate the effective pressure of

28. A soil mass is subjected to a vertical stress. Calculate the effective pressure of

29. A soil mass is subjected to a vertical stress. Calculate the effective pressure of

30. A soil mass is subjected to a vertical stress. Calculate the effective pressure of
